| Total: | 75 |  |

How I can achieve better:

1. Figure shows part of the curve $y=m \cos (x-n)$, where $x$ is measured in degrees.

The constants $m$ and $n$ are integers and $n$ is such that $0<n<90^{\circ}$.
For $x>0$, the curve first crosses the $x$-axis at the point $A(120,0)$ and the first minimum is at the point $B(210,-4)$.
(a) Find the values of $m$ and $n$.

The curve above may also be written in the form $y=p \sin (x+q)$, where $p$ and $q$ are integers and $0<q<90^{\circ}$.
(b) Write down the values of $p$ and $q$.
2.

$$
\mathrm{f}(x) \equiv x^{3}-5 x^{2}+3 x+2
$$

(a) Find $\mathrm{f}^{\prime}(x)$.
(b) Hence, or otherwise, find the set of values of $x$ for which $\mathrm{f}(x)$ is decreasing.
3. Given that $\sin \left(15^{\circ}\right)$ is exactly

$$
\frac{\sqrt{3}-1}{2 \sqrt{2}}
$$

show that $\cos ^{2}\left(15^{\circ}\right)$ can be written as

$$
\frac{m+n \sqrt{3}}{4}
$$

where $m$ and $n$ are positive integers.
4.

$$
\mathrm{f}(x) \equiv x^{2}-2 x-6
$$

(a) By expressing $\mathrm{f}(x)$ in the form $A(x+B)^{2}+C$, prove that $\mathrm{f}(x) \geq-7$.
(b) Solve the equation $\mathrm{f}(x)=0$, giving your answers correct to 2 decimal places.
5.

$$
y^{\frac{1}{2}}=2 x^{\frac{1}{3}}+1 .
$$

(a) Show that $y$ can be written in the form

$$
y=A x^{\frac{2}{3}}+B x^{\frac{1}{3}}+C
$$

where $A, B$ and $C$ are positive integers.
(b) Hence, evaluate

$$
\int_{1}^{8} y \mathrm{~d} x
$$

6. The first two terms of a geometric series are $(x+2)$ and $\left(x^{3}+2 x^{2}-x-2\right)$ respectively.
(a) Find the common ratio of the series as a quadratic expression in terms of $x$.
(b) Express the second term of the series as a product of 3 linear factors.

Given that $x=\frac{1}{2}$,
(c) show that the sum to infinity of the series is $\frac{10}{7}$.
7. Figure shows the inside of a running track.

The track consists of two straight sections of length $l$ metres, joined at either end by semicircles of diameter $h$ metres.
(a) Find, in terms of $h$ and $l$, expressions for
i. the perimeter of the track,
ii. the area of the track.

Given that the track must have a perimeter of 400 metres,
(b) show that the area, $A \mathrm{~m}^{2}$, enclosed by the track is given by

$$
A=200 h-\frac{\pi h^{2}}{4} .
$$

In order to stage the field events, $A$ must be as large as possible. Given that $h$ can vary,
(c) find the maximum value of $A$, giving your answer in terms of $\pi$,
(d) justify that your value of $A$ is a maximum.
8. Figure shows the sector $P Q R$ of a circle, centre $P$.

The tangents to the circle at $Q$ and $R$ meet at the point $S$.
The shape $P Q S R$ has $x=4$ as a line of symmetry.
Given that $P$ and $Q$ are the points with coordinates $(4,11)$ and $(1,5)$ respectively,
(a) find the gradient of the line $P Q$,
(b) find an equation of the tangent to the circle at $Q$,
(c) show that the radius of the circle can be written in the form $a \sqrt{5}$ where $a$ is a positive integer which you should find,
(d) show that the angle subtended by the minor arc $Q R$ at $P$ is 0.927 radians correct to 3 decimal places,
(e) find the area of the shaded region enclosed by the $\operatorname{arc} Q R$ and the lines $Q S$ and $R S$.
