SUGGESTIONS TO [DRYUFROMSHANGHAI@QQ.COM](mailto:DRYUFROMSHANGHAI@QQ.COM)

## Section A: Pure Mathematics

- 1 (i) Prove that, for any positive integers  $n$  and  $r$ ,

$$\frac{1}{{}^{n+r}C_{r+1}} = \frac{r+1}{r} \left( \frac{1}{{}^{n+r-1}C_r} - \frac{1}{{}^{n+r}C_r} \right).$$

Hence determine

$$\sum_{n=1}^{\infty} \frac{1}{{}^{n+r}C_{r+1}},$$

and deduce that  $\sum_{n=2}^{\infty} \frac{1}{{}^{n+2}C_3} = \frac{1}{2}$ .

- (ii) Show that, for  $n \geq 3$ ,

$$\frac{3!}{n^3} < \frac{1}{{}^{n+1}C_3} \quad \text{and} \quad \frac{20}{{}^{n+1}C_3} - \frac{1}{{}^{n+2}C_5} < \frac{5!}{n^3}.$$

By summing these inequalities for  $n \geq 3$ , show that

$$\frac{115}{96} < \sum_{n=1}^{\infty} \frac{1}{n^3} < \frac{116}{96}.$$

**Note:**  ${}^nC_r$  is another notation for  $\binom{n}{r}$ .

- 2 The transformation  $R$  in the complex plane is a rotation (anticlockwise) by an angle  $\theta$  about the point represented by the complex number  $a$ . The transformation  $S$  in the complex plane is a rotation (anticlockwise) by an angle  $\phi$  about the point represented by the complex number  $b$ .

- (i) The point  $P$  is represented by the complex number  $z$ . Show that the image of  $P$  under  $R$  is represented by

$$e^{i\theta}z + a(1 - e^{i\theta}).$$

- (ii) Show that the transformation  $SR$  (equivalent to  $R$  followed by  $S$ ) is a rotation about the point represented by  $c$ , where

$$c \sin \frac{1}{2}(\theta + \phi) = a e^{i\phi/2} \sin \frac{1}{2}\theta + b e^{-i\theta/2} \sin \frac{1}{2}\phi,$$

provided  $\theta + \phi \neq 2n\pi$  for any integer  $n$ .

What is the transformation  $SR$  if  $\theta + \phi = 2\pi$ ?

- (iii) Under what circumstances is  $RS = SR$ ?

- 3 Let  $\alpha, \beta, \gamma$  and  $\delta$  be the roots of the quartic equation

$$x^4 + px^3 + qx^2 + rx + s = 0.$$

You are given that, for any such equation,  $\alpha\beta + \gamma\delta$ ,  $\alpha\gamma + \beta\delta$  and  $\alpha\delta + \beta\gamma$  satisfy a cubic equation of the form

$$y^3 + Ay^2 + (pr - 4s)y + (4qs - p^2s - r^2) = 0.$$

Determine  $A$ .

Now consider the quartic equation given by  $p = 0$ ,  $q = 3$ ,  $r = -6$  and  $s = 10$ .

- (i) Find the value of  $\alpha\beta + \gamma\delta$ , given that it is the largest root of the corresponding cubic equation.
- (ii) Hence, using the values of  $q$  and  $s$ , find the value of  $(\alpha + \beta)(\gamma + \delta)$  and the value of  $\alpha\beta$  given that  $\alpha\beta > \gamma\delta$ .
- (iii) Using these results, and the values of  $p$  and  $r$ , solve the quartic equation.

- 4 For any function  $f$  satisfying  $f(x) > 0$ , we define the *geometric mean*,  $F$ , by

$$F(y) = e^{\frac{1}{y} \int_0^y \ln f(x) dx} \quad (y > 0).$$

- (i) The function  $f$  satisfies  $f(x) > 0$  and  $a$  is a positive number with  $a \neq 1$ . Prove that

$$F(y) = a^{\frac{1}{y} \int_0^y \log_a f(x) dx}.$$

- (ii) The functions  $f$  and  $g$  satisfy  $f(x) > 0$  and  $g(x) > 0$ , and the function  $h$  is defined by  $h(x) = f(x)g(x)$ . Their geometric means are  $F$ ,  $G$  and  $H$ , respectively. Show that  $H(y) = F(y)G(y)$ .

- (iii) Prove that, for any positive number  $b$ , the geometric mean of  $b^x$  is  $\sqrt{by}$ .

- (iv) Prove that, if  $f(x) > 0$  and the geometric mean of  $f(x)$  is  $\sqrt{f(y)}$ , then  $f(x) = b^x$  for some positive number  $b$ .

- 5 (i) The point with cartesian coordinates  $(x, y)$  lies on a curve with polar equation  $r = f(\theta)$ . Find an expression for  $\frac{dy}{dx}$  in terms of  $f(\theta)$ ,  $f'(\theta)$  and  $\tan \theta$ .
- (ii) Two curves, with polar equations  $r = f(\theta)$  and  $r = g(\theta)$ , meet at right angles. Show that where they meet
- $$f'(\theta)g'(\theta) + f(\theta)g(\theta) = 0.$$
- (iii) The curve  $C$  has polar equation  $r = f(\theta)$  and passes through the point given by  $r = 4$ ,  $\theta = -\frac{1}{2}\pi$ . For each positive value of  $a$ , the curve with polar equation  $r = a(1 + \sin \theta)$  meets  $C$  at right angles. Find  $f(\theta)$ .
- (iv) Sketch on a single diagram the three curves with polar equations  $r = 1 + \sin \theta$ ,  $r = 4(1 + \sin \theta)$  and  $r = f(\theta)$ .

- 6** In this question, you are not permitted to use any properties of trigonometric functions or inverse trigonometric functions.

The function  $T$  is defined for  $x > 0$  by

$$T(x) = \int_0^x \frac{1}{1+u^2} du,$$

and  $T_\infty = \int_0^\infty \frac{1}{1+u^2} du$  (which has a finite value).

- (i)** By making an appropriate substitution in the integral for  $T(x)$ , show that

$$T(x) = T_\infty - T(x^{-1}).$$

- (ii)** Let  $v = \frac{u+a}{1-au}$ , where  $a$  is a constant. Verify that, for  $u \neq a^{-1}$ ,

$$\frac{dv}{du} = \frac{1+v^2}{1+u^2}.$$

Hence show that, for  $a > 0$  and  $x < \frac{1}{a}$ ,

$$T(x) = T\left(\frac{x+a}{1-ax}\right) - T(a).$$

Deduce that

$$T(x^{-1}) = 2T_\infty - T\left(\frac{x+a}{1-ax}\right) - T(a^{-1})$$

and hence that, for  $b > 0$  and  $y > \frac{1}{b}$ ,

$$T(y) = 2T_\infty - T\left(\frac{y+b}{by-1}\right) - T(b).$$

- (iii)** Use the above results to show that  $T(\sqrt{3}) = \frac{2}{3}T_\infty$  and  $T(\sqrt{2}-1) = \frac{1}{4}T_\infty$ .

7 Show that the point  $T$  with coordinates

$$\left( \frac{a(1-t^2)}{1+t^2}, \frac{2bt}{1+t^2} \right) \quad (*)$$

(where  $a$  and  $b$  are non-zero) lies on the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

(i) The line  $L$  is the tangent to the ellipse at  $T$ . The point  $(X, Y)$  lies on  $L$ , and  $X^2 \neq a^2$ . Show that

$$(a+X)bt^2 - 2aYt + b(a-X) = 0.$$

Deduce that if  $a^2Y^2 > (a^2 - X^2)b^2$ , then there are two distinct lines through  $(X, Y)$  that are tangents to the ellipse. Interpret this result geometrically. Show, by means of a sketch, that the result holds also if  $X^2 = a^2$ .

(ii) The distinct points  $P$  and  $Q$  are given by  $(*)$ , with  $t = p$  and  $t = q$ , respectively. The tangents to the ellipse at  $P$  and  $Q$  meet at the point with coordinates  $(X, Y)$ , where  $X^2 \neq a^2$ . Show that

$$(a+X)pq = a-X$$

and find an expression for  $p+q$  in terms of  $a, b, X$  and  $Y$ .

Given that the tangents meet the  $y$ -axis at points  $(0, y_1)$  and  $(0, y_2)$ , where  $y_1 + y_2 = 2b$ , show that

$$\frac{X^2}{a^2} + \frac{Y}{b} = 1.$$

8 Prove that, for any numbers  $a_1, a_2, \dots$ , and  $b_1, b_2, \dots$ , and for  $n \geq 1$ ,

$$\sum_{m=1}^n a_m(b_{m+1} - b_m) = a_{n+1}b_{n+1} - a_1b_1 - \sum_{m=1}^n b_{m+1}(a_{m+1} - a_m).$$

(i) By setting  $b_m = \sin mx$ , show that

$$\sum_{m=1}^n \cos\left(m + \frac{1}{2}\right)x = \frac{1}{2}(\sin(n+1)x - \sin x) \operatorname{cosec} \frac{1}{2}x.$$

**Note:**  $\sin A - \sin B = 2 \cos\left(\frac{A+B}{2}\right) \sin\left(\frac{A-B}{2}\right).$

(ii) Show that

$$\sum_{m=1}^n m \sin mx = (p \sin(n+1)x + q \sin nx) \operatorname{cosec}^2 \frac{1}{2}x,$$

where  $p$  and  $q$  are to be determined in terms of  $n$ .

**Note:**  $2 \sin A \sin B = \cos(A-B) - \cos(A+B);$

$2 \cos A \sin B = \sin(A+B) - \sin(A-B).$

## Section B: Mechanics

- 9 Two particles  $A$  and  $B$  of masses  $m$  and  $2m$ , respectively, are connected by a light spring of natural length  $a$  and modulus of elasticity  $\lambda$ . They are placed on a smooth horizontal table with  $AB$  perpendicular to the edge of the table, and  $A$  is held on the edge of the table. Initially the spring is at its natural length.
- (i) Particle  $A$  is released. At a time  $t$  later, particle  $A$  has dropped a distance  $y$  and particle  $B$  has moved a distance  $x$  from its initial position (where  $x < a$ ). Show that  $y + 2x = \frac{1}{2}gt^2$ .
- (ii) The value of  $\lambda$  is such that particle  $B$  reaches the edge of the table at a time  $T$  given by  $T = \sqrt{6a/g}$ . By considering the total energy of the system (without solving any differential equations), show that the speed of particle  $B$  at this time is  $\sqrt{2ag/3}$ .

- 10 A uniform rod  $PQ$  of mass  $m$  and length  $3a$  is freely hinged at  $P$ .

- (i) The rod is held horizontally and a particle of mass  $m$  is placed on top of the rod at a distance  $\ell$  from  $P$ , where  $\ell < 2a$ . The coefficient of friction between the rod and the particle is  $\mu$ .

The rod is then released. Show that, while the particle does not slip along the rod,

$$(3a^2 + \ell^2)\dot{\theta}^2 = g(3a + 2\ell) \sin \theta,$$

where  $\theta$  is the angle through which the rod has turned, and the dot denotes the time derivative.

- (ii) Hence, or otherwise, find an expression for  $\ddot{\theta}$  and show that the normal reaction of the rod on the particle is non-zero when  $\theta$  is acute.
- (iii) Show further that, when the particle is on the point of slipping,

$$\tan \theta = \frac{\mu a(2a - \ell)}{2(\ell^2 + a\ell + a^2)}.$$

- (iv) What happens at the moment the rod is released if, instead,  $\ell > 2a$ ?

- 11** A railway truck, initially at rest, can move forwards without friction on a long straight horizontal track. On the truck,  $n$  guns are mounted parallel to the track and facing backwards, where  $n > 1$ . Each of the guns is loaded with a single projectile of mass  $m$ . The mass of the truck and guns (but not including the projectiles) is  $M$ .

When a gun is fired, the projectile leaves its muzzle horizontally with a speed  $v - V$  relative to the ground, where  $V$  is the speed of the truck immediately before the gun is fired.

- (i) All  $n$  guns are fired simultaneously. Find the speed,  $u$ , with which the truck moves, and show that the kinetic energy,  $K$ , which is gained by the system (truck, guns and projectiles) is given by

$$K = \frac{1}{2}nmv^2 \left(1 + \frac{nm}{M}\right).$$

- (ii) Instead, the guns are fired one at a time. Let  $u_r$  be the speed of the truck when  $r$  guns have been fired, so that  $u_0 = 0$ . Show that, for  $1 \leq r \leq n$ ,

$$u_r - u_{r-1} = \frac{mv}{M + (n-r)m} \quad (*)$$

and hence that  $u_n < u$ .

- (iii) Let  $K_r$  be the total kinetic energy of the system when  $r$  guns have been fired (one at a time), so that  $K_0 = 0$ . Using (\*), show that, for  $1 \leq r \leq n$ ,

$$K_r - K_{r-1} = \frac{1}{2}mv^2 + \frac{1}{2}mv(u_r - u_{r-1})$$

and hence show that

$$K_n = \frac{1}{2}nmv^2 + \frac{1}{2}mvu_n.$$

Deduce that  $K_n < K$ .

**Section C: Probability and Statistics**

- 12** The discrete random variables  $X$  and  $Y$  can each take the values  $1, \dots, n$  (where  $n \geq 2$ ). Their joint probability distribution is given by

$$P(X = x, Y = y) = k(x + y),$$

where  $k$  is a constant.

- (i)** Show that

$$P(X = x) = \frac{n + 1 + 2x}{2n(n + 1)}.$$

Hence determine whether  $X$  and  $Y$  are independent.

- (ii)** Show that the covariance of  $X$  and  $Y$  is negative.

- 13** The random variable  $X$  has mean  $\mu$  and variance  $\sigma^2$ , and the function  $V$  is defined, for  $-\infty < x < \infty$ , by

$$V(x) = E((X - x)^2).$$

- (i)** Express  $V(x)$  in terms of  $x$ ,  $\mu$  and  $\sigma$ .
- (ii)** The random variable  $Y$  is defined by  $Y = V(X)$ . Show that

$$E(Y) = 2\sigma^2. \quad (*)$$

- (iii)** Now suppose that  $X$  is uniformly distributed on the interval  $0 \leq x \leq 1$ . Find  $V(x)$ . Find also the probability density function of  $Y$  and use it to verify that  $(*)$  holds in this case.
